# AES256XTSSTGIP Demo Instruction

Rev1.00 25-Aug-2023

This document describes the instruction to demonstrate the operation of AES256XTSSTGIP on VCK190 Evaluation Board. In the demonstration, AES256XTSSTGIP are used to encrypt and decrypt data between two memories in FPGA. User can fill memory with plain or cipher data patterns, set encryption key, tweakable key, Initialization Vector (IV) and control test operation via serial console.

## 1 Environment Setup

To operate AES256XTSSTGIP demo, please prepare following test environment.

- 1) FPGA development boards (VCK190 board).
- 2) Test PC.
- 3) USB type-C cable for JTAG connection connecting between VCK190 board and Test PC.
- 4) Vivado tool for programming FPGA installed on Test PC.
- 5) Serial console software such as TeraTerm installed on PC. The setting on the console is
- 6) Baudrate=115200, Data=8-bit, Non-parity and Stop=1.
- 7) Batch file named “AES256XTSSTG2XIPTest\_VCK190.bat” (To download these files, please visit our web site at [www.design-gateway.com](http://www.design-gateway.com))

Figure 1-1 AES256XTSSTGIP demo environment on VCK190 board

## 2 VCK190 board setup

- 1) Make sure power switch is off and connect power supply to FPGA development board.
- 2) Connect USB cables between FPGA board and PC via USB type-C ports.
- 3) Power on system.

- 4) Download configuration file and firmware to FPGA board by following step,
  - a) open Vivado TCL shell.
  - b) change current directory to download folder which includes demo configuration file.
  - c) Type “AES256XTSSTG2XIPTest\_VCK190.bat”, as shown in Figure 2-1.

### 3 Serial Console

User can fill RAMs with plain or cipher data patterns, set encryption key, set tweakable key, IV and control test operation via serial console. When configuration is completed, AES256XTSSTGdemo command menu will be displayed as shown in Figure 3-1. The detailed information of each menu is described in topic 4.

```

=====
AES256XTSSTGENC Version = 0x00011040
AES256XTSSTGDEC Version = 0x00011040

++++++ AES256XTSSTG2X Demo Menu ++++++

## 4 Command detail and testing result

### 4.1 Set encryption key

Step to set encryption key as follows

- a) Select “1. Set rEncEKeyIn and rDecEKeyIn”.
- b) Current rEncEKeyIn will be displayed on serial console as shown in Figure 4-1.
- c) Set new rEncEKeyIn: User is allowed to input new key in hex format or press “enter” to skip setting new key. Then the current encryption key is printed again.
- d) Current rDecEKeyIn key will be displayed on serial console.
- e) Set new rDecEKeyIn key: User is allowed to input new key in hex format or press “enter” to use rEncEKeyIn as rDecEKeyIn. Then the current decryption key is printed again.

```

## 4.5 Fill Plain Data Memory

Step to fill plain data in memory as follows

- a) Select “5. Fill Plain Data Memory”.
- b) Input the desired number of 512-byte data. User can press “enter” to use the default value of plain data. user can a select data pattern.
- c) There are four pattern to fill memory.
  - a. zero pattern
  - b. 8-bit counter
  - c. 16-bit counter
  - d. 32-bit counter
- d) Whole plain data memory is filled with selected data pattern.

```

## 4.6 Encrypt

Step to encrypt data as follows

- Select "6. Encrypt" to encrypt plain data in memory.
- Input parameter for IvIncrement.
- When the encryption process is finished, both plain data and cipher data will be displayed in table-form as shown in Figure 4-6.

```

## 4.7 Fill Cipher Data Memory

Step to fill Cipher data in memory as follows

- a) Select “7. Fill Cipher Data Memory”.
- b) Input the desired number of 512-byte data. User can press “enter” to use the default value of Cipher data. user can select data pattern.
- c) There are four pattern to fill memory.
  - a. zero pattern
  - b. 8-bit counter
  - c. 16-bit counter
  - d. 32-bit counter
- d) Whole cipher data memory is filled with selected data pattern.

```
